

## REMARKS

Claims in Groups I through IV are all drawn to oligonucleotides designed to enrich for lysine in a reserve protein from maize (Group I, claims 1-3, 23, 42-50, 52-55, 57-64, 69-75, 77-82), non-maize cereal plants (Group II, claims 1-3, 23, 42-50, 56, 58-59, 61, 63, 69-72, 76, 77-78, 80-81), leguminous or cruciferous plants (Group III, claims 1-3, 23, 42-49, 51, 56, 58-59, 61, 63, 69-72, 76, 77-78, 80-81), and non-cereal, non leguminous, non cruciferous plants (Group IV, claims 1-3, 23, 42-49, 56, 58-59, 61, 63, 69-72, 76, 77-78, 80-81). Each group also concerns host cells and plants from the same species transformed with the recombinant nucleotide.

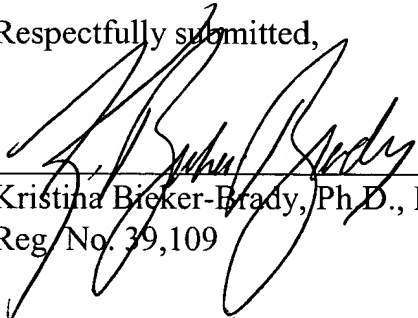

In the Office Action, Examiner asserts that a gamma-zein protein is to be considered as the sole reserve protein in Group I, yet mentions only "a reserve protein" for Groups II-IV of the invention. We point out that the elected claims cover oligonucleotides designed to enrich for lysine in any reserve protein from maize (i.e., not only gamma-zein proteins), as well as to maize host cells and maize plants transformed with these sequences.
